

BIRD BALLS

The better cover for outdoor use

Water-filled Bird Balls protect open liquid surfaces (water ponds, airport ponds or rainwater collection basins) from contamination, algae formation and danger from flying birds. The cover camouflages the liquid so that birds do not recognize it and do not settle there. At airports, this reduces the risk of flying birds immensely.

Easy installation

Installation is extremely simple – the floating balls are poured onto the liquid from the bank or pool edge. They spread independently and evenly over the surface to form an even cover without overlaps. This creates a stable yet flexible layer that automatically adapts to the surface even when the water level rises or falls.

Equipment and devices can still be pulled through the liquid if required.

Ingenious functional principle

The floating balls always cover 91 % of the surface (with a single-layer cover) – **algae growth in the pool is prevented and evaporation is reduced by up to 90 %.**

The round shape also means that the Bird Balls clean themselves when it rains – dirt and deposits are simply washed away, eliminating the time and cost of cleaning.

With a weight of 240g per ball, the Bird Balls lie deeper in the medium than other covers – this makes them **extremely resistant to strong winds** (up to wind force 12) and prevents the floating balls from being blown off the medium. The black coloring also makes the Bird Balls **UV-stable and weather-resistant**. Our supplier offers a 10-year guarantee on durability.

The Bird Balls have a **high life expectancy of 25-30 years** and are **maintenance-free**.

Size **HDPE 100 mm** • Demand **116 pcs/sqm** • Weight **40g** (without filling) / **240g** (water-filled) • Colour **black**
